

## **SCHAUMALAC PRO AKTIV**

### **supplementary feed as paste –**

### **the healthy start into a piglets life with BONVITAL**

#### **The problem:**

More than 60 % of the piglet losses occur in the first 4 days of life in the suckling phase. Major causes are crushing losses and a lacking immune defence against pathogen germs.

#### **The solution:**

SCHAUMALAC PRO AKTIV is applied within the first hours of life into the mouth using the reliable dosage-pistol. One pump (2 ml) is enough to support the vitality and the natural immune defence of the piglet in the first days of life.

#### **SCHAUMALAC PRO AKTIV with BONVITAL acts:**

- Stabilising on the intestinal flora and replaces or inhibits pathogen germs such as E. coli. Furthermore BONVITAL leads to a reestablishment of the natural intestinal flora after a therapy with antibiotics.
- Supplementary to the natural immunity which was secured by the uptake of colostrum due to its special equipment and therefore enhances the natural immunity against pathogen germs in the intestine and blood circuit.
- Supporting the general immune defence mechanisms through the selected vitamins A, E and C as well as through its highly digestible trace elements. The relatively high content of these supplements very effectively amends these active substances of the colostrum.
- As supplier of highly utilizable energy and hence replenishes the scarce energy reserves of the newborn pigs in the first hours of life.

#### **The advantages of SCHAUMALAC PRO AKTIV:**

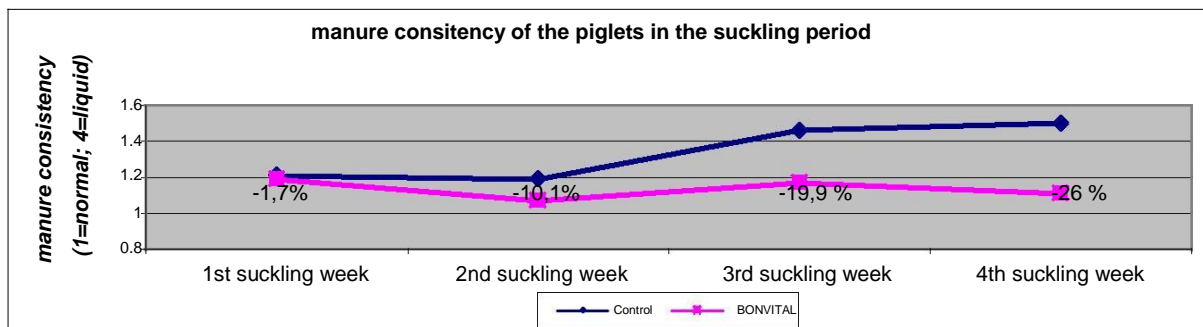

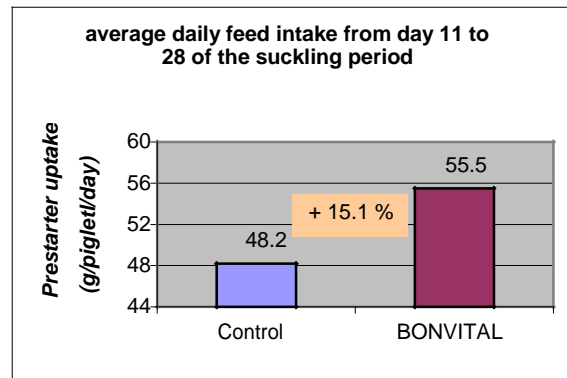

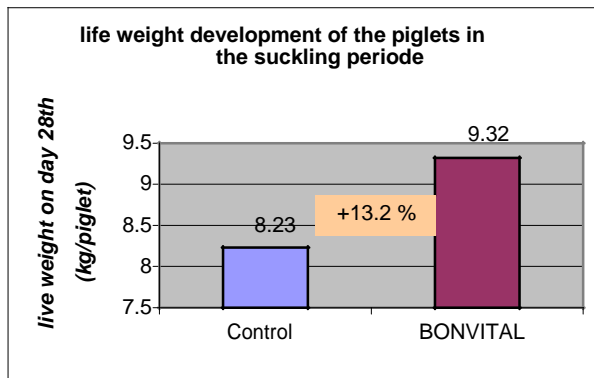

- Lesser crushing losses of the newborn piglets.
- Lesser weaklings at constant growth development of all piglets of a litter
- Reduced cases of early diarrhoea in the first days of life.
- More weaned piglets per sow and year.

**SCHAUMALAC PRO AKTIV**  
**Prevention is the better way!**

## Feeding experiment:

### Freie Universität Berlin:

- Freie Universität Berlin, Schweinezucht Kerkow
- 20 Sows between the 96th day of gestation and the 28th day of lactation
- Application of Bonvital via SCHAUMALAC PRO AKTIV and a prestarter (control group without Bonvital, respectively)
- Sow feed without Bonvital
- Parameters: live weight development, feed intake, manure consistency of the piglets

The very positive gain development in the piglets of the Bonvital group can only partly be traced back to the higher prestarter uptake. It was rather the better utilization of the nutrients due to strengthening of the gut flora and the immune system that led to the higher gain. So, more energy was available for body mass accretion.

### Farm Rovišće (about 600 Sows) in Croatia:

Wolf Štefica, dr. vet. med; October 2008

SCHAUMALAC PRO AKTIV was used with 2ml per piglet given within the first 24 hours after birth!

	Control		SCHAUMALAC PRO AKTIV	
Sows	36		34	
Live born piglets	374		367	
Weak born piglets	34		34	
- deaths of it	10	<b>29.4 %</b>	5	<b>14.7 %</b>
Total losses	25	<b>6.7 %</b>	15	<b>4.1 %</b>

SCHAUMALAC PRO AKTIV group showed better appetite, was more vital and healthier and also reached higher weaning weight! SCHAUMALAC PRO AKTIV reduced losses of weak born piglets by 50% and total losses by more than 30%
